

Brazilian convergence switch is resistant to high temperatures

Overview

To succeed in the Brazilian market, you must choose combiner boxes with at least IP66 protection and UV-stabilized polycarbonate 1 materials. You need components that handle temperatures up to 70°C and have C5-M corrosion resistance 2 for coastal areas. Brazil's tropical environment – with soaring temperatures, high humidity, and frequent storms – poses unique challenges for electrical installations, demanding cables that withstand heat-induced derating and moisture without compromising safety. Quality manufacturing prevents failures. 'Axon' cables are tough! They are engineered, as required, to meet a huge range of electrical, mechanical and environmental challenges, which could include: Signal, power, data transmission, high frequency, high voltage, high data rate. These rules ensure not only efficiency but also public safety, reducing risks of accidents, fires, or power failures. Businesses and professionals working with electrical. The EGE high temperature proximity switches are based on the conventional inductive principle and switch when a metallic object moves close. Sensors are available for the most varied applications.
