

Bridge to PoE switch

Summary of Content

You can bridge a PoE switch to remote devices using either PoE passthrough or a wireless PoE bridge like the UniFi Device Bridge.

Using PoE Passthrough

Some PoE devices, such as Ubiquiti airMAX M radios, support PoE passthrough, allowing power and data to pass from the main PoE switch port to a secondary device. To enable this, you activate the secondary Ethernet port in the device's configuration console (airOS AC or M) and ensure PoE passthrough is enabled. This setup allows a second device to receive both power and network connectivity without additional cabling. It is recommended to use a higher-wattage PoE supply (e.g., 24W) to ensure sufficient power for the downstream device .

Wireless PoE Bridges

When running Ethernet cables is impractical, a wireless PoE bridge can connect devices to a PoE switch over Wi-Fi. The UniFi Device Bridge (UDB) family provides this functionality by converting a Wi-Fi signal into a wired Ethernet connection while supplying PoE power. The base UDB model delivers up to 15W of PoE, suitable for devices like 2K HD cameras or VoIP phones, while higher-end models like the UDB Switch support Wi-Fi 7 uplinks and multiple Multi-Gig PoE+ ports for more demanding devices .

Key Features of Wireless PoE Bridges

- **Power Delivery:** Provides PoE to connected devices, eliminating the need for separate power cables.
