

Common electrical distribution boxes in Congo

Summary of Content

In Congo, electrical distribution boxes range from high-voltage substation units to industrial and 380V low-voltage cabinets, designed to withstand harsh climates and unstable grid conditions.

High-Voltage Distribution Boxes

For large-scale transmission projects, such as the Congo-Gilli to Maluku 220kV line, distribution boxes are installed at substations to manage and distribute electricity efficiently across urban and rural areas. These boxes are engineered to withstand extreme weather conditions, integrate seamlessly with the national grid, and ensure safety and reliability for high-voltage operations. They are typically used in substations and major transmission nodes.

Industrial and Factory Distribution Cabinets

Factories and industrial facilities in Congo often face frequent voltage fluctuations, blackouts, and limited grid capacity. To address this, customized industrial distribution cabinets are deployed. These cabinets are usually made from cold-rolled steel with anti-corrosion treatments to endure high temperatures, humidity, and dust. They often include intelligent multi-power switching systems, integrating mains, solar PV, and diesel generators with interlock logic to maintain uninterrupted power supply. These cabinets are suitable for both indoor and outdoor installations and comply with IEC standards commonly adopted in African markets.
