

Configuration Requirements for Transformer Distribution Boxes

Overview

- The transformer should be positioned correctly with complete accessories, normal oil level for oil-immersed transformers, and no oil leakage. - The grounding method and resistance value of the transformer neutral point should meet the design requirements. - The foundation should be inspected and accepted as qualified, and the conduits embedded in the. A distribution box is a low-voltage electrical enclosure that receives incoming power and distributes it safely to multiple outgoing circuits through protective and switching devices such as MCBs, RCDs, RCBOs, fuses, isolators, busbars, neutral bars, earth bars, and surge protective devices. The Switch disconnecter to e provided. The distribution box (cabinet) is suitable for temporary power supply at the construction site and should meet the requirements of "three-level power distribution, two-level leakage protection, one machine one switch, one leakage one box" for power distribution and protection. Incoming Porcelain Fuse units as per IS: 2086/1993 with latest Amendment/ Revision.
