

Connecting wires to the distribution box interface

Summary of Content

To connect wires in a distribution box safely, first turn off the main power, then connect the incoming live and neutral wires to the main breaker, distribute power through circuit breakers, and ensure proper grounding.

Step-by-Step Wiring Process

1. Safety First Always turn off the main power supply before starting any work to prevent electrical shock. Wear insulated gloves and use tools rated for electrical work . 2. Mount the Distribution Box Secure the box to a wall at an accessible height, ensuring it is level and free from obstructions. For outdoor installations, use a waterproof box with a protective cover . 3. Identify Input and Output Wires

- Incoming wires: Typically, the live (phase) wire is brown or red, and the neutral wire is blue or black.

- Outgoing wires: These connect to individual circuits in your home or facility . 4. Connect the Main Power

- Attach the incoming live wire to the input terminal of the main MCB (double-pole if required).

- Connect the incoming neutral wire to the neutral link.

- Connect the earth wire from the supply to the earth terminal in the box . 5. Install Circuit Breakers

- Place single-pole MCBs for individual circuits and double-pole MCBs for high-power loads.
