

Core switch periodically disconnects

Overview

An Ethernet connection is usually more stable than Wi-Fi, so repeated disconnects often point to a specific problem: a loose cable, a failing port, router glitches, outdated drivers, power-saving settings, or a bad network configuration. We have a 3750g switch stack at the core, and a couple of remote closet switches that connect to the core. All endpoints and servers/printers are on a single VLAN. This just started happening a few days. Hi, I have a X570-F Mainboard from Asus with an Intel I211 Ethernet Controller. These disconnects don't stop until I fully reset my Switch. I'm sure I removed the correct VLANs. I haven't been able to reproduce or find any patterns in when this occurs. I could go several days without problems and then have it happen. When your network connection drops frequently while using a network switch, it can be a frustrating and disruptive experience. Understanding the reasons behind this issue is crucial for troubleshooting and resolving the problem effectively.
