

Double-layer door of the distribution box

Summary of Content

A double-layer door distribution box features an outer and inner door, providing enhanced safety, operational efficiency, and protection for electrical components.

Design and Structure

Double-layer door distribution boxes consist of two doors:

- Outer door: Provides access to frequently used components such as circuit breaker handles and indicator lights, allowing routine operations without exposing high-voltage parts.
- Inner door: Acts as a sealed barrier for high-voltage lines and core electrical components, creating a safety buffer zone that minimizes the risk of direct contact with live parts and reduces arc flash hazards . The inner compartment is often sealed to achieve IP55 or higher protection, safeguarding components from dust, moisture, and corrosion .

Safety Benefits

- Accidental contact prevention: The inner door reduces the risk of electric shock by physically isolating live components .
- Arc flash mitigation: Confines potential arc flash incidents to the inner compartment, protecting personnel and equipment .
- Integrated protection: Many cabinets include overload, short-circuit, and leakage protection, ensuring rapid disconnection of faulty circuits to prevent fire or equipment damage .

Operational Efficiency
