

How to assign IP addresses to ports on a core switch

Summary of Content

To configure IP addresses on core switch ports, you typically assign the IP to a VLAN interface or convert a port to Layer 3, then set the IP and subnet mask via CLI.

Step 1: Access the Switch

Connect to the switch using one of the following methods:

- Console cable with a terminal emulator (PuTTY, Tera Term)
- SSH if the switch already has an IP configured
- Web interface (optional for some managed switches)

Step 2: Enter Global Configuration Mode

From privileged EXEC mode:

```
Switch> enableSwitch# configure terminal
```

Step 3: Configure a VLAN Interface (Management IP)

Most switches use a VLAN interface for IP configuration:

```
Switch(config)# interface vlan 1Switch(config-if)# ip address 192.168.1.10  
255.255.255.0Switch(config-if)# no shutdownSwitch(config-if)# exit
```

- Replace 192.168.1.10 and 255.255.255.0 with your desired IP and subnet mask
- VLAN 1 is default, but you can use another VLAN if preferred
