

How to secure the distribution box

Summary of Content

A distribution box should be secured using proper mounting hardware, environmental sealing, and a lock or lockout device to prevent unauthorized access and ensure safety.

Physical Mounting

To secure a distribution box, first ensure it is mounted on a stable surface such as a wall or dedicated frame. The mounting hardware should match the wall material—drywall, concrete, or plaster—and be capable of supporting the box's weight and any internal components (). Use screws, anchors, or bolts appropriate for the enclosure type, and maintain manufacturer-recommended clearances to allow full door operation and safe access to breakers or fuses ().

Environmental Protection

Select a distribution box with an IP or NEMA rating suitable for the installation environment. For outdoor or damp locations, IP66 or IP67 is recommended, while high-pressure washdown areas may require IP69K (). Seal all cable entry points with cable glands or grommets to prevent dust, moisture, or corrosive substances from entering the enclosure ().

Access Control

To prevent unauthorized access, install a panel lock or fuse box lock. Options include:

- Full panel locks: Hasp or cam locks securing the entire door, preventing accidental or intentional opening ().
