

How to store network cables inside a cable management rack

Summary of Content

Organize network cables by planning layout, separating cable types, using vertical and horizontal management, labeling, and bundling with Velcro or cable trays for airflow and scalability.

Plan Your Rack Layout

Start by mapping out your rack, identifying all devices, and planning their positions. Place heavier equipment like UPS systems at the bottom for stability, and frequently accessed or lighter devices higher up. Allocate extra U-space (about 30%) for future expansion and ensure sufficient rack depth for modern PoE++ switches and fiber connections .

Separate and Route Cables

- Separate power and data cables to prevent electromagnetic interference .
- Use horizontal cable managers to guide patch cords within the same rack unit and vertical organizers along rack sides for longer runs .
- Avoid tight bundling, especially with high-power PoE cables, to prevent overheating .

Use Cable Management Accessories

- D-rings, cable trays, and baskets help secure and guide cables neatly .
- Velcro straps are preferred over zip ties because they are adjustable and do not damage cables .
