

How to wire the control switch of the distribution box

Summary of Content

To wire a controlled switch in a distribution box, connect the phase wire from the main supply through the protective devices (MCB/RCCB) to the switch, then from the switch to the load, while neutral and earth are connected to their respective busbars.

Step-by-Step Wiring Process

-

Turn Off Power: Ensure the main supply is disconnected before starting any wiring to prevent electric shock.

-

Identify Components: In a typical single-phase distribution box, you will have:

- Main MCB (Double Pole): Acts as the main isolator.
- RCCB/RCD: Provides protection against electric shock.
- Single-Pole or Double-Pole MCBs: Control individual loads.
- Neutral and Earth Busbars: For neutral and grounding connections .

-

Connect Main Supply: Connect the incoming phase (live) and neutral wires from the energy meter to the input terminals of the main MCB. The main MCB output then feeds the RCCB input. Connect the earth wire to the earth busbar .
