

Installation Method of Double-Layer Horizontal Distribution Box

Summary of Content

A double-layer horizontal distribution box should be installed on a stable, accessible surface, with proper mounting, wiring, and environmental protection to ensure safe and efficient operation.

Site Selection and Preparation

Choose a location that is easily accessible for maintenance and close to the main power supply. Avoid areas near water, flammable, explosive, or corrosive substances. For outdoor installations, ensure the box has adequate waterproofing and dust protection, typically with an IP66 or NEMA 4X rating depending on environmental conditions. The surface should be flat and stable, capable of supporting the weight of the double-layer box.

Mounting the Box

- Mark the mounting points on the wall or support structure according to the box dimensions.
- Drill holes and insert appropriate anchors or bolts for secure attachment.
- Level the box horizontally to ensure proper alignment of both layers.
- Secure the box firmly using bolts or screws, ensuring it does not wobble or tilt.

Internal Wiring and Component Installation

- Open the box and install DIN rails if required for mounting circuit breakers, RCDs, or other devices.
