

Maintenance of the core switch NRZ

Overview

This standard details the inspection regime, monitoring procedures, immediate actions and essential maintenance to be undertaken at switches to control the risk of derailment, maximise asset life and deliver good operational availability. The model includes a detailed description of 400/230 kV transmission systems of all Continental Europe countries, with no details on the sub-transmission and distribution networks. The principles and requirements on electricity balancing, as set out in this Annex, shall be. You need to find out the network topology and what features the switch is actually performing today. I will put a non exhaustive list here: -Remove VLANs that are no longer in use -Remove configured ports / etherchannels that are no longer in use -Is your switch also performing layer 3 or other. The stable running of switches depends on the proper network planning and routine maintenance and monitoring on the switches. It is necessary to find hidden hazards during routine maintenance and monitoring. Core files can be saved either manually by a user or automatically at the time of the fault.
