Overview

OPGW serves a dual function as both a ground wire for fault current protection and a medium for telecommunications via embedded optical fibers. To maintain system integrity and ensure the safety of personnel, grounding techniques are essential when accessing and splicing OPGW. An optical fiber composite overhead ground wire (OPGW) is a new type of ground cable used in the high-voltage power transmission system that serves as both a conventional overhead ground cable and a communication optical cable. Because of this, OPGW contains exposed elements made of both stainless steel and aluminium. It should therefore not be used in high count designs. OPGW is primarily used by the electric utility industry, placed in the secure topmost position of the transmission line where it “shields” the all-important conductors from lightning while providing a telecommunications path for internal as well as third party communications. Optical Ground Wire is. This manual is formulated in accordance with IEEE 1138 - 2008 and IEEE 524 - 1992, etc. The installation rules of OPGW are basically the same as the.

An optical ground wire (also known as an OPGW or, in the IEEE standard, an optical fiber composite overhead ground wire) is a type of cable that is used in overhead power lines. Such cable combines the functions of grounding and telecommunications. An OPGW cable contains a tubular structure with one or more optical fibers in it, surrounded by layers of steel and aluminum wire. The OPGW cable is run between the tops of high-voltage electricity pylons. The conductive part of the cable serves to bond adjacent tow
