

PCM Digital Fiber Optic Communication System

Overview

Fiber optic PCM, or Pulse Code Modulation in optical communication systems, is a digital modulation technique used to encode analog signals into digital data for transmission over optical fiber networks. 4 PCM Voice Telephone Media Converter Over Fiber with Ethernet Diagram The PCM Voice Telephone system over one Fiber Optic S/M up to 20Km (12. with one 10/100Mbps Ethernet for network extending, also can use for IP camera with RJ45 connector, SC fiber interface (FC/ST/LC. Digital transmission systems are the backbone of modern communication networks, enabling the exchange of information across various media, such as copper wires, optical fibers, radio waves, and satellites. This method ensures improved resistance to noise, minimal signal degradation, and efficient bandwidth utilization. A PCM system converts an analog input signal to the digital signal, which is a combination of the binary sequence created from the binary digits 0 and 1. An analog signal is a continuous wave, and the PCM signal is a wave with a series of digits.
