

Revit cable tray elbow

Summary of Content

In Revit MEP, cable tray elbows are configured through type properties, including bend radius, vertical/horizontal bend types, and routing preferences, ensuring proper automatic fitting placement.

Setting Up Cable Tray Elbows

-

Use the Correct Cable Tray Type: Always select Cable Tray with Fittings rather than without fittings. This ensures Revit can automatically generate elbows, tees, and crosses when the tray changes direction or elevation ().

-

Edit Type Properties: Right-click the cable tray and choose Edit Type. Key settings include:

- Bend Radius Multiplier: Adjusts the curvature of elbows; larger values create smoother bends.
- Vertical Inside/Outside Bend: Defines how the tray transitions vertically.
- Horizontal Elbows: Set the radius for horizontal 45° or 90° bends.
- Tee, Cross, and Reducer Settings: Configure these if your routing requires intersections or size changes ().
