

ST250 Original Charging Port

Summary of Content

The Lenovo ThinkSystem ST250 uses standard AC input power through its hot-swap CRPS power supply modules, which serve as the original charging/power connection.

Power Input and Charging Port Details

The ThinkSystem ST250 server supports AC input only and does not use DC input for power. The original charging port is integrated into the hot-swap CRPS (Common Redundant Power Supply) modules, which connect directly to the server's AC power source. Each CRPS module must have the same wattage, manufacturer, and part number to ensure proper operation and redundancy. The server does not support 240-VDC input, so only standard AC power cables compatible with the CRPS module should be used.

Replacement and Compatibility

- To replace the original charging port or power input, you should use official Lenovo CRPS modules designed for the ST250 series.
- Ensure that the replacement module matches the wattage and part number of the existing unit to maintain system stability and redundancy.
- The server supports hot-swap power supplies, allowing replacement without shutting down the system, which is critical for enterprise environments.

Installation Notes

- Connect the AC power cable to the CRPS module securely.
- Verify that the power button LED lights up to confirm proper connection.
