

The distribution box is not fully open

Summary of Content

A distribution box that does not fully open is often caused by misaligned covers, locked connectors, or internal obstructions, and can be resolved by following proper unlocking and assembly procedures.

Check for Mechanical Locks and Keyed Covers

Many distribution boxes, such as Powersafe units, have key locks for Earth, Neutral, and phase connectors. If the Earth or L3 lock is engaged, the cover may not fully open until the lock is turned to the correct position. Ensure you turn the key clockwise or anticlockwise as specified and raise the cover fully before attempting to access other connectors. Covers are designed to prevent disconnection of previous connections while open, so partially open covers may indicate that a connector is still engaged.

Inspect for Obstructions or Misalignment

- Internal components such as insulators or connectors may be misaligned. Only fully assembled connectors should be inserted; unassembled parts can block the cover from opening.
- If misalignment occurs, reinsert the insulators and rotate fully to reset the mechanism.
- Check for dust, debris, or corrosion inside the box that may physically prevent the cover from moving.

Verify Electrical Connections
