

Waterproofing of wall-mounted electrical distribution boxes

Summary of Content

Proper waterproofing of electrical distribution boxes inside walls requires selecting IP-rated enclosures, using high-quality gaskets, sealing cable entries, and ensuring correct installation to prevent moisture ingress.

Choosing the Right Enclosure

Select a waterproof distribution box with an appropriate IP rating, typically IP65 or higher, which ensures protection against dust and water jets . Materials like ABS, polycarbonate, or stainless steel are recommended for durability and corrosion resistance . For wall-mounted installations, consider boxes with internal mounting plates and molded pillars to keep components isolated from condensation .

Sealing and Gaskets

A critical factor is the sealing mechanism. Use high-grade polyurethane or silicone gaskets around the lid and entry points to create a continuous barrier . Ensure that latches or screws apply uniform pressure to maintain the seal over time. Minimize seams and openings in the enclosure to reduce potential water ingress .

Cable Entry and Conduit Protection

Install liquid-tight cable glands for all incoming and outgoing wires . Pre-molded knockout holes should be sealed with rubber washers or grommets. For wall-mounted boxes, ensure that conduits are properly sealed at the wall penetration points to prevent water from wicking along the conduit into the box .
