

What does laying optical cables in ducts mean

Summary of Content

Optical cables in ducts are primarily installed using two methods: pulling and blowing, each suited to specific distances, duct conditions, and cable types.

Pulling Method

The pulling method involves manually or mechanically pulling the cable through a pre-installed duct, often using a rope or pull line already placed inside the duct. This method is commonly used in short-distance installations, typically up to 200-300 meters, such as in access networks. Key considerations include:

- Cable handling: Avoid excessive pulling tension, bending, or crushing forces to prevent damage to the optical fibers.
- Bend radius: Maintain the minimum bend radius during installation, often specified as 15 times the cable diameter for working radius.
- Coiling: Use figure-eight coiling for cable storage at manholes to prevent kinking or twisting, with loops generally 5-8 feet in diameter.
- Limitations: Pulling is less efficient for long ducts with multiple bends, as friction and stress on the cable increase.

Blowing (Air Jetting) Method

The blowing method, also called air jetting, uses compressed air combined with a mechanical pushing force to install the cable inside the duct. This method is preferred for longer ducts or routes with multiple bends and undulations. Key features include:
