

Which port on the optical splitter is the fastest

Overview

A 1Gbps OLT port with a 1:32 splitter gives each subscriber ~31Mbps (theoretical)—enough for streaming 4K video, gaming, and home office use. to the service provider and the need for more cable management as well as additional splicing. It also faces challenges with duct and pole capacity, especially in aerial networks. Passive Operation: Splitters have no active electronics, so they require no power, cooling, or maintenance—lowering operational costs (OPEX) for ISPs. They are named by the number of inputs and outputs, so a splitter with one input and 2 outputs is a 1X2, and a PON splitter with one input and 32 outputs is a 1X32. Thorlabs' Single Mode Fiber-Based Polarization Beam Combiners (PBC) or Splitters are designed to either combine two orthogonal polarizations into a single fiber or split a single input into its orthogonal linear polarizations through two fiber outputs.
