

Whole House Fiber Optic Cable Installation

Summary of Content

Installing fiber optic cable throughout your home ensures high-speed, reliable internet by connecting all areas directly to your main network via fiber or Cat6 wiring.

Planning and Preparation

Before installation, map your home layout to determine where fiber will enter, where the ONT (Optical Network Terminal) will be placed, and which rooms require direct connections. Consider future needs, such as home offices, media rooms, or smart home devices. Decide whether the fiber will run aerially from a pole or underground through conduits, and identify potential obstacles like walls, floors, or HVAC systems .

Choosing the Right Cable

- Outdoor segments: Use ruggedized, weatherproof fiber rated for burial or aerial runs to withstand moisture and temperature changes .
- Indoor segments: Use riser or plenum-rated fiber for air-handling spaces to reduce fire risk and smoke production .
- Fiber type: Multimode (OM3/OM4) is suitable for runs under 300 meters, while single-mode (OS2) is ideal for long distances and future-proofing .

Installation Steps

- Fiber Drop to Home: The ISP brings fiber from the local distribution point (fiber pod or cabinet) to your home, either underground or via utility poles .
