

Wiring method for the 4-layer distribution box

Summary of Content

A 4-layer distribution box should be wired with organized layers, proper wire sizing, color-coded connections, and secure breaker arrangements to ensure safety and maintainability.

Preparation and Material Requirements

Before wiring, ensure all materials and tools are ready: circuit breakers, wires, cable ties, terminal blocks, screwdrivers, wire strippers, multimeter, and insulation resistance tester. Verify that wires meet the required specifications for each circuit load, and that all components are undamaged and certified for use . Wear personal protective equipment such as insulating gloves, safety glasses, and slip-resistant shoes during installation .

Layer Arrangement

In a 4-layer distribution box, organize the layers as follows:

- Top Layer: Main incoming power and main circuit breaker.
- Second Layer: High-priority circuits such as lighting and essential appliances.
- Third Layer: Medium-load circuits like air conditioning or kitchen equipment.
- Bottom Layer: Low-priority or auxiliary circuits, including sockets and non-critical devices . Circuit breakers should be arranged from left to right, with reserved positions typically on the right side for future expansion .

Wiring Method
